DATA RIDE

Open Source. Open Data. Open Future.

What is DATA-RIDE?

DATA-RIDE is a citizen science and advocacy project developed within the LAUDS Factories programme in collaboration with Université de Lorraine. The project explores how citizen-generated data can contribute to understanding cycling conditions and support evidence-informed discussions about urban mobility. Using open-source sensors (senseBox:bike), cyclists collected data during everyday journeys. The collected information was processed then interpreted collectively and transformed into communication materials and policy recommendations.

DATA-RIDE follows a cyclical process
Listen -> Measure -> Interpret -> Communicate ->Advocate -> Improve

/ Activities
Map the local cycling landscape
Contact key actors
Conduct snowball interviews
Formulate hypotheses

/ Outputs
Stakeholder map
Prioritised hypotheses

/ Activities
Hardware and software development
Mounting and testing
Calibration
Documentation

/ Outputs
Working prototype
Open documentation

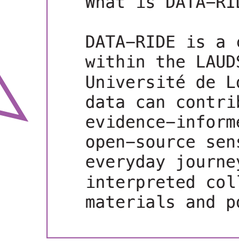

/ Activities
Recruit volunteers
Install sensors
Collect data
Provide ongoing support

/Outputs
Citizen-generated dataset

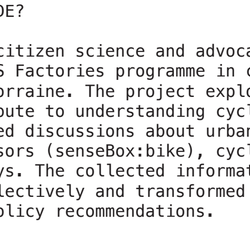

/ Activities
Data analysis
Public presentations
Group discussions
Identification of emerging findings

/ Outputs
Shared insights
Emerging hypotheses

/ Activities
Co-creation workshops
Visuals and slogans
Posters and stickers
Online dissemination

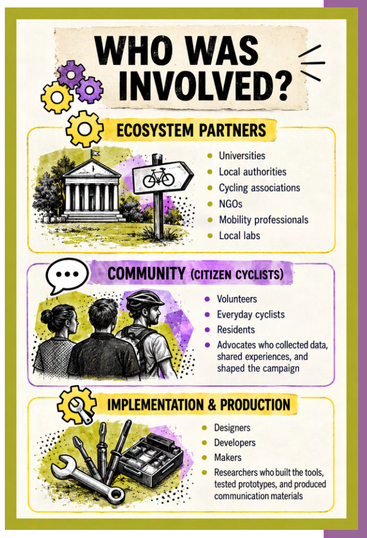

/ Outputs
Campaign materials
Shared messages

/ Activities
Draft recommendations
Validation with partners
Sustainability planning

/ Outputs
Policy recommendations
Sustainability roadmap

Key Learnings

1. **Citizen-Generated Data Matters**
It reveals everyday experiences that are often missing from traditional planning datasets.

2. **Cycling Safety Is More Than Infrastructure**
Safety depends on the quality of interactions between mobility modes, street design and user behaviour.

3. **Collective Interpretation Creates Impact**
Workshops and public dialogue transform data into shared understanding and meaningful action.

Key Findings

/ Calm & Cyclable Neighbourhoods
Traffic calming, protected infrastructure, greener public spaces and participatory planning encourage cycling adoption.

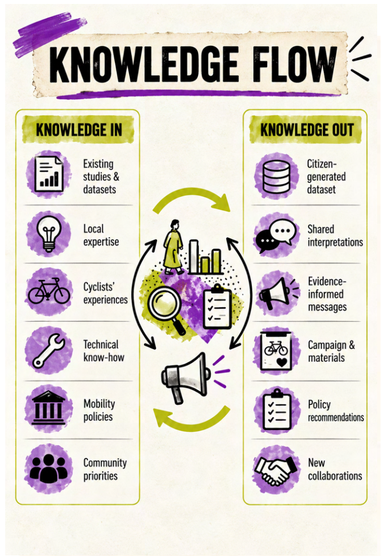

/ Interactions Between Mobility Modes
Cycling safety emerges from interactions between cyclists, drivers, pedestrians and street design—not infrastructure alone.

/ Night-Time Safety & Visibility
Lighting gaps and visibility conditions influence cycling comfort, confidence and adoption, particularly after dark.

Sustainability Plan

By measuring, interpreting and communicating together, communities can transform everyday experiences into informed advocacy and tangible improvements for cycling.

From Data to Change

Evidence → Awareness → Dialogue → Action → Better Cycling City
